

GLOBALVOX

SOFTWARE ENGINEERING ASSESSMENT

Duration: 3 Hours

CONTEXT

GlobalVox is organising an upcoming business event.

The event team has a list of people who have been invited to the event.

The team wants to use **GlobalVox's AI voice agent** to call these invitees and collect their RSVP.

The AI agent will call each person and have a short conversation to determine whether they:

- **Will attend the event**
- **Will not attend the event**
- **Are unsure / need to decide later**

The AI agent may also capture relevant information from the conversation.

For this assessment, **you do not need to build the actual AI voice agent or make real phone calls.**

Instead, build the application that the GlobalVox team would use to **manage and execute this RSVP calling campaign and track its results.**

THE CHALLENGE

Build a working prototype for managing the event RSVP campaign.

A GlobalVox team member should be able to take a list of invitees, create an RSVP campaign, initiate the calling process and understand the results.

1. INVITEE LIST

The event team has a list of invitees.

Each invitee contains information such as:

```
id
name
phone
email
```

Example:

```
id,name,phone,email
1,Rahul Sharma,+919876543210,rahul@example.com
2,Priya Shah,+9198123456789,priya@example.com
3,Amit Patel,+919999999999,amit@example.com
```

The list may contain a small number of invitees or a very large number.

The application should allow the event team to bring this list into the system.

Handle invalid or incomplete data appropriately.

2. RSVP CAMPAIGN

The GlobalVox team should be able to create an RSVP campaign.

For example:

Event

GlobalVox Annual Business Meet

Event Date

25 October 2026

Event Location

Ahmedabad

Campaign

Annual Business Meet — RSVP

AI Calling Objective

The AI agent should contact each invitee and determine whether they will attend the event.

The conversation itself will be handled by the simulated calling service.

You do not need to build the conversational AI.

3. START THE CAMPAIGN

A user should be able to start the RSVP campaign.

The application should then attempt to process the invitees through the simulated AI calling service provided with this assessment.

No real calls should be made.

The calling service will simulate the behaviour of an external AI calling provider.

4. RSVP RESULTS

The GlobalVox team needs to understand the outcome of the campaign.

At minimum, the system should allow the user to distinguish between invitees who:

- Confirmed attendance
- Declined
- Are undecided
- Have not yet been successfully contacted

You may decide whether additional statuses or information would be useful.

For example, the campaign dashboard might show:

GlobalVox Annual Business Meet

Total Invitees: 1,000

Confirmed: 620

Declined: 80

Undecided: 50

Pending:	200
Failed:	50

The exact interface and presentation are up to you.

5. INDIVIDUAL INVITEE

The user should be able to understand what happened with an individual invitee.

For example:

```
Name: Rahul Sharma
Phone: +91XXXXXXXXXX

Campaign: Annual Business Meet – RSVP

Status: Confirmed

Call: Completed
```

You may decide what additional information would be useful to the event team.

6. CALLING SERVICE

The application communicates with an external service that represents the AI calling system.

The service is provided as part of this assessment.

The service may not always behave perfectly.

Use the information available to you while developing and testing your application to understand how it behaves.

Your application should respond appropriately when things do not go as expected.

7. BUSINESS SCALE

GlobalVox may use this system for events with very different numbers of invitees.

For example:

- 100 invitees
- 1,000 invitees
- 10,000 invitees
- potentially 100,000+ invitees

AI calls can have different durations because conversations with different people will not take exactly the same amount of time.

The system should therefore be designed with the eventual scale of the business problem in mind.

You do not need to build a production-scale system within this assessment.

8. BUSINESS USER

The person using this application is a **GlobalVox event/business team member**, not a software developer.

The application should make it easy for them to understand:

- Which event/campaign is being managed
- How many people have been contacted
- How many have confirmed
- How many have declined
- How many are undecided
- Which people are still pending
- Which calls encountered problems
- What happened with an individual invitee

You may make additional product decisions that you believe would make the application more useful.

YOUR APPROACH

The requirements above describe the business problem.

They do not prescribe how you should solve it.

You are expected to make reasonable decisions about:

- Product behaviour
- User experience
- Data handling
- Campaign execution

- Error handling
- Status management
- Architecture
- Technology

Prioritise what you believe is most important within the available time.

TECHNOLOGY

There is no prescribed technology stack.

You may use:

- Any programming language
- Any framework
- Any database
- Any libraries
- Any architecture
- Any development tools

Choose whatever you believe is appropriate for the problem.

The sophistication of your technology stack is not being evaluated.

The quality of your solution is.

AI AND OTHER RESOURCES

You may use **any resources you consider useful**, including:

- ChatGPT
- Claude
- Gemini
- GitHub Copilot
- Internet
- Google
- Documentation
- GitHub
- Stack Overflow
- Open-source libraries
- Other development tools

You are responsible for the final solution you submit.

TIME

You have **3 hours**.

You are not expected to build a complete production system.

Prioritise intelligently.

A smaller working solution is better than a large incomplete one.

DEPLOYMENT

Your application must be deployed and accessible through a **live Vercel URL**.

The evaluator must be able to open and use your application.

Make sure the deployed application is functional before submitting.

SUBMISSION

You must submit:

1. LIVE APPLICATION

Your **Vercel deployment URL**.

2. CODEBASE

A ZIP file containing your complete codebase.

Send the ZIP file and Vercel URL by email to:

shivi.sharma@globalvoxinc.com

devvrat.solanki@globalvoxinc.com

Your email should include:

- Full name
- Vercel URL

- Any important instructions required to evaluate the application
-

README

Include a README in your codebase containing:

- How to run the application locally
 - Architecture / design overview
 - Important technical decisions
 - Major assumptions
 - Known limitations
 - What you would improve with more time
-

AI USAGE

Include a short section in your README describing:

- Which AI tools you used
 - What you used them for
 - One useful contribution from AI
 - One situation where you verified, modified or rejected AI-generated output
-

FINAL DEMONSTRATION

You should be prepared to demonstrate your application and explain your decisions.

Be prepared to discuss:

- What you built
- Why you built it that way
- Important technical decisions
- What you would change with more time
- Anything that is incomplete
